Date: Oct-22-2015

2.40 (b) (2)

DIRECT NCI

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\*\*At least 4 of the adult dogs at the facility were identified as having excessively long toe nails; female MC# 4B09654D55, Male MC# 0A02227007, Female MC# 032849359, Male MC# 0A0155020. The female MC identification # 4B09554D55 had extremely long nails that curled to the side of her digits. Excessively long toenails can become entrapped and torn or can result in abnormally positioned toes, which is painful. The licensee must establish an effective program of toenail maintenance.  
TO BE CORRECTED BY: 10/28/2015

\*\*A puppy with the identification # 15279 was unresponsive and lying curled up in its enclosure. This puppy along with its 3 litter mates identification # s 15280, 15281, 15282 were evaluated by a veterinarian during a routine 7 week check-up on October 14, 2015. The veterinarian verbally confirmed to the inspector that the puppies were in acceptable health at the time of their appointment: they displayed a slight decrease in appetite and a small amount of clear nasal discharge, which the veterinarian did not find uncommon for puppies of that life-stage. The puppies were administered a routine regimen of "parvo mix" and Zithromycin, which the licensee made record of providing from 10/14-10/18. One of the puppies, identification # 15282 died; the licensee could not provide the date of death. The licensee did not consult with a veterinarian concerning the change in health, resulting in death of this puppy (#15282) or the shared symptoms and deterioration in condition of the second puppy (#15279) which was observed in distress during the inspection. Direct and frequent communication of an animal's health and behavior in conjunction with formal examinations by a licensed veterinarian are required to provide adequate and timely diagnosis and veterinary care.

Inspectors requested that the licensee have the sick puppy evaluated by a licensed veterinarian to obtain a diagnosis and treatment plan, and that a written record of the visit be made available during the next inspection.  
Note: the licensee made an appointment with the attending veterinarian and departed directly following the inspection on October 22, 2015.

*Puppy Unresponsive  
Lying curled up in enclosure.*

### 2.40 (b) (2) REPEAT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

\*\*At least 3 of the adult dogs at the facility were identified as having excessively long toe nails; female Westie MC# 0A02256059, male Westie MC#049301275, female MC#000013318362. The adult female MC#000013318362 had extremely long nails that curled to the side of her digits. Excessively long toenails can become entrapped and torn or can result in abnormally positioned toes, which is painful. The licensee must establish an effective program of toenail maintenance.

\*\*\* In addition to having excessively long toe nails the female, adult dog MC#000013318362 was holding her rear leg up. She intermittently put the leg down but did not bear full weight or stand correctly on the leg. The condition was identified by the inspectors and the dog was not receiving treatment. Lameness can be painful and maybe the indication of a serious medical condition. The licensee shall have the dog seen by a licensed veterinarian to obtain a written diagnosis and treatment plan, and should provide follow-up care as prescribed.

\*\*Note: The licensee trimmed the toe nails of the 4 adult dogs identified in the previous inspection. The licensee also provided health records for puppy with the identification # 15279 which was seen by the attending veterinarian.

*Excessively  
long  
toe  
nails

flaking of the wire which does not allow for proper sanitization of the wire. The wire needs to be replaced or altered in a manner that allows for proper cleaning and sanitization every two weeks.

Correction date: 10/01/14

3.6 (a) (2) (ix)

### PRIMARY ENCLOSURES.

In four of the buildings housing dogs, the enclosures are made with a vinyl frame that has been excessively chewed by the dogs. This damage allows dirt and food waste to penetrate the surface of the vinyl which can result in disease hazards towards the dogs. The vinyl frame needs to be replaced or altered in a manner that allows for proper cleaning and sanitization of the enclosure every two weeks.

Correction date: 10/01/14

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A male Maltese, microchip #071381853, was observed breathing rapidly and lying mostly in a prone position in the enclosure. Upon closer observation of this dog it was observed that he is also very thin. His hip bones, back bones, ribs and leg bones are easily palpable. The rapid breathing and thinness could be a sign of a medical condition. The licensee must have this dog evaluated by a veterinarian for an appropriate diagnosis and treatment plan. The licensee must ensure that all animals receive adequate veterinary care at all times.  
To be corrected by: 17 July 14

### 2.40 (b) (2) REPEAT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

A female French Bulldog with microchip number 029 104 122 had an abnormal discharge from the anal area that varied in color from tan to reddish brown to deep red in color. A small amount of blood was also observed in the stools in this enclosure. The licensee stated that he had just given dewormer to this dog. There is no written documentation noting observations or treatment provided to this dog by the licensee. No communication by the licensee with the attending veterinarian has occurred regarding this dog and since the dog has not been diagnosed, it is unclear if proper treatment is being administered by the licensee. If not properly treated, the condition could worsen and result in other negative health effects. This dog must be examined by the attending veterinarian for diagnosis and prescribed treatment. Documentation must be maintained by the licensee on any evaluations, diagnosis and treatment provided.

Abnormal  
dischg  
anal  
area.  
Blood  
observed.

### 3.1 (c) (1)

#### HOUSING FACILITIES, GENERAL.

Surfaces - General requirements.

Three enclosures in the small breeder building and two enclosures in the large breeder building housing a combined total of 10 adult dogs had excessive chewing/scratching damage to the plastic supports within the enclosure. The excessive chewing/scratching damage has caused grooves in the plastic leaving a rough surface that is allowing dirt and debris to accumulate in the grooves. These surfaces cannot be readily cleaned and sanitized, which could affect the health of the animals by harboring bacteria and other disease hazards in the grooves. Replace or repair chewed surfaces to reduce or eliminate these risks. Correct by 28 August 2014.

### 3.1 (c) (3)

#### HOUSING FACILITIES, GENERAL.

Surfaces - Cleaning

The upper portions of the breeder enclosures have a buildup of fur and dust on the enclosure wire and

## Inspection Report

ledges. The bungee cords securing the food receptacles to the enclosures also have a buildup of fur and dust on them. Several of the doggie doors in the large breeder building have a dark brown organic matter buildup on the surfaces of the doors. Inadequate cleaning of surfaces allows a buildup to occur, which increases risk of disease and does not satisfy generally accepted husbandry standards and practices. Remove this buildup from upper portion of enclosures, bungee cords and doggie doors and maintain all surfaces of housing facilities on a regular basis to prevent an accumulation. Correct by 31 July 2014.

Dog #105800831 documented under 2.40(b)(2) on the previous inspection conducted on 20 February 2014 has been addressed.

Inspection and exit interview conducted with the owner.

*Dental Disease -  
dark brown material  
on surface of  
teeth.  
gray creamy material  
along gums.*

2.40 (b) (2)

### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Attending veterinarian and adequate veterinary care (dealers and exhibitors)

A male Shih Tzu with microchip number 105800831 had wet fur around its mouth. The front teeth, canine teeth and cheek teeth on both sides of the mouth had a dark brown material on the surface of the teeth. There was a grayish colored creamy material extended along the line where the teeth meet the gums.

These signs are consistent with the presence of dental disease. Dental disease can be painful and lead to a decreased appetite and systemic health problems. The licensee must, in consultation with the facility veterinarian, appropriately address the dental health of this dog and develop and maintain a preventative dental program to be included in the facility's program of veterinary care. Correct by March 6, 2014.

Inspection and exit interview conducted with the owner.

### 3.11 (a)

#### CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

Cleaning of primary enclosures.

In the adult dog building containing 68 dogs there is an excessive accumulation of feces underneath the enclosures at the west end of the building. The accumulation of feces can cause odor problems, attract pests, and other disease hazards. The feces must be removed from under the enclosures daily or as often as necessary to reduce disease hazards, insects, pests, and odors.

To be corrected by October 7, 2014

Type: ROUTINE INSPECTION

Date: Feb-04-2014

### 3.9 (b)

#### FEEDING.

\*\*\* There is a mixture of dirt and grime caked on the interior trough of four plastic feeders in four different enclosures. The feeders are located in the multi-level building, eleven dogs are in contact with the feeders. The affected area was covering 30 to 40 percent of the interior trough. It can harbor bacteria and other disease causing agents that can affect the health and well-being of the dogs. The licensee must ensure that all food receptacles are kept clean and can be sanitized at all times.

\*\*\* Seven metal feeders had an excessive buildup of bird feces on the tops of the feeders. The receptacles are located in the outdoor housing area, fifteen dogs are in contact with the feeders. Surfaces caked with bird droppings cannot be readily cleaned and sanitized. Feed contaminated with droppings is not healthy to be consumed, affecting the health and well-being of the dogs. The licensee must ensure that all food receptacles are kept clean and can be sanitized at all times.

To be corrected by February 15, 2014

Exit interview conducted with facility representative.
